Can Kings Create Towns that Thrive? The effects of town plantation on urbanisation and agriculture in Sweden 1570-2010

GGDC 25th Anniversary Conference 28-30 June 2017

Kerstin **Enflo** Alexandra **López-Cermeño**

ENFLO & LOPEZ-CERMEÑO

The questions

Q1. Can urbanisation cause agricultural growth?

- Agricultural surplus is a pre-requisite for urban development.
 - Childe (1936), Wrigley (1985), Allen (2001)
- Causality from urbanisation to development.
 - Jacobs (1969), Kopsidis and Wolf (2012), Martinelli (2015)

Q2. Can policy interventions lead to permanent effects?

- Fundamentals explains long-run location of production.
 - Davis and Weinstein (2002)
- Long-term effects of policy intervention
 - Eg. infrastructure investments (Jedwab & Moradi, 2016, Berger & Enflo, 2017)

Testing the specialisation model

• Parish A becomes a town.

How will the neighbouring parish B respond?

Full specialisation if: $Surplus_B > Subsistence \ need_A - Transportation \ costs_{AB} - Tax$

• Sweden as the testing ground:

- Autarky?
 - Prohibition of trade on the country-side since the 13th century.
 - Customs of all goods traded in towns 1/32 of sales value.
 - Was the policy enforced? Ending rural trade was as difficult as to "catch all the wolves of the woods". *Heckscher (1963, p.77)*
- An open economy?
 - Towns had monopoly rights to trade with their hinterland, only staple towns had rights to trade with foreign ports.

The town plantantion policy

- According to Gustav II Adolf, Swedish towns were "lacking trade, rotten, and falling apart... broken down and impoverished". *Rystad (1987, p. 92)*
- Deliberate town plantations.
 - 32 planted town between 1570 and 1810.
 - Control and tax trade.
 - Little urban development. Location based on land availability. Sandberg (1996, p. 186)
 - Unparalleled policy in Europe during the early modern period.
 - All the parishes granted town charters materialized as built towns.
 - There are few cases of parishes that were to be granted town chaters, but the Monarchs eventually changed their minds.

Our approach

- Test the impact of planted towns on agricultural surplus in their neighbouring parishes.
- 2,218 geocoded parishes measured at 60 year intervals (panel).
 - Extensive growth:
 - Population
 - Gross production
 - Intensive growth (surplus):
 - Gross production per capita
 - Yields

Data sources

- Lilja (1996), Town populations 0
- Andersson-Palm (2012a,b, 2013) Linde, 2012, Linde & 0 Andersson-Palm (2014), Gothenburg University

Constant parish borders 1571-1810

- Original data from kameral and fiscal sources:
 - 1570: Tax Records (*Älvborgs lösen*, 1571), Church registers. For Denmark, Lunds stifts landebok.
 - **1630:** Tax records (boskaps- och utsädeslängderna), • Church registers (Jordeboken).
 - 1690: Indelningsverk eller indelningsjordeböcker. •
 - 1750: Church registers, Estate inventories, Official • Statistics.
 - 1810: Church registers, Estate inventories, Official Statistics.

"... privileges of township were conferred upon a great number of communities which were <u>without</u> <u>any potentialities for urban economic development</u>."

Hecksher (1963, page 50)

0 30 60

120 180 240

- Arbitrary locations.
- Kristianopel named after Kristian IV of Denmark – First renaissance town of the Nordic countries.
- Burnt down in 1611 by Gustav Adolphus.

The Swedes favoured location of Karlskrona 35 km away in 1680.

9

672 changes in "distance to town"...

...can be used in a panel model with fixed effects (diff-in-diff model with varying treatment intensities):

 $Ln(outcome)_{it} = a + \beta_1^* distance to town_{it} + \gamma_t + \rho_i + \varepsilon_{it}$

ENFLO & LOPEZ-CERMEÑO

A `settlement policy'

Parishes exposed to a planted town (="treated") had lower grain production, surplus and soil quality **on average**

Averages in 1570	Whole Sample	Treated	Untreated	Means diff (p.val H0≠0)

1.00

Growth effect market vs counterfactual (short run)

Organic constraints in towns

Illustrative example in Woude, de Vries and Hayami (1990):
 A 5,000 inhabitants town would need:

- 15-30 cartloads of firewood per day.
- 5 cartloads with bread grain per day.
- implied the need for forest reserve of 25-40 km².

Country	Soil Suitability Index			GJ/pc Annual Firewood
	Max	Mean	SD	Consumption (1800)
England	9,987	4,182	2,877	2.2
Sweden	9,889	1,312	1,867	37.8
Germany	10,000	5,220	2,297	7.4
Italy	10,000	2,340	2,474	9.3
Spain	9,835	2,696	1,820	12.7
France	10,000	5,364	2,799	9.2

Source: Crop suitability index (value) for high input level rain-fed cereals from FAO/IIASA, 2011-2012. Annual Firewood Consumption in 1800 from Kander et al (2013) and Teives and Borowiecki (2017).

Heckscher (1954, p.50): "These communities remained rural settlements equipped with the legal status of a town"

Mean population of planted towns and counterfactual parishes

Conclusions

Q1. Can urbanisation cause agricultural growth?

- YES. But mainly through extensive growth.
- Intensive growth dependent on sufficient soil quality and takes time.
- The result show the organic constraints to urbanisation in the pre-industrial era.

Q2. Can geographical interventions have persistent long-run effects?

- The planted towns were nothing more than just 'rural settlements equipped with legal status of a town' by 1810.
- YET, path-dependency created towns that thrived until today.
- Potential mechanisms are:
 - coordination of future investments or
 - sunk investments with slow depreciation rates.

Thank you!

ENFLO & LOPEZ-CERMEÑO
